                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Submitted (07-CCT-1998) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Oct 1, 1998 this sequence version replaced gi:3482897.
Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality does not meet this standard, it will be indicated in the annotation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Submitted (01-OCT-1998) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to disgnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wntt-Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.

                                                                              This invention describes a novel human conductin protein which has anti-tumour activity. Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation resulting in blockade of the Winty Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2701

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
Nucleic acids encoding mutant and wild type Axin and oligonuclectides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for traeting subjects who are likely to develop cancer (thyroid carcinomas). The nucleic mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions

                                                                                                                                                                                                                             1022
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 3411 BP;

The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mutations

sequences A77722-A78199 represent 478 cDNAs encoding proteins or CC portions of proteins which are associated with human colon tumours. CC The invention also specifically discloses 8 human colon tumour proteins CC (B11897-B11904). The nucleic acids, the polypeptides they encode, and CC antigen presenting cells (APCs, preferably dendritic cells) expressing CC such polypeptides may be used in vaccines that target tumour cells, color tumour cells, thereby inhibiting the development of CC cancer. T-cells specific for the polypeptide expressed by the APC are CC used to remove tumour cells, thereby inhibiting the development of CC cancer. T-cells specific for the polypeptide expressed by the APC are CC polypeptide can then be used to inhibit cancer development. CD4+ and/or CD8+ T-cells from a patient may be incubated with a polypeptide or the nucleic acid of the invention, or an APC expressing such a polypeptide, to cause the proliferation of specific T-cells. The T-cells can be CC cloned and then administered back to the patient to inhibit cancer development. Nucleic acids encoding the polypeptides and antibodies of a tumour protein of the invention, and therefore to determine whether concerce cells are present. Such diagnostic methods may also be used to cancer cells are progression of a cancer by repeating the processes at time intervals, and comparing the current result to previous results. The concerned concerned sequence represents a cDNA encoding a human colon tumour

                  Recombinant production of PIGI-1 allows the study of the structure, function and role in oncogenesis of the protein. PIGI-1 and nucleic acid encoding it can also be used to develop products for use in treating tumours and cancer and in the diagnosis of cancer.

CR1 expression is rapidly and transiently induced by II-2, and mRNA expression is suppressed by elevated intracellular cAMP. It encodes an intracellular protein (W08133) that shows homology to GOS8 and BI-34. CR genes and polypeptides (W08133-40) can be used as diagnostic or therapeutic agents; CR gene sequences can be used to detect and treat allelic

                                                                                                                                                                                                                      This invention describes a novel isolated antibody or antibody fragment (I) which selectively binds to a polypeptide encoded by cytokine response gene 2 (CR2) and modulates CR2 activity. The products of the invention have cytostatic, anti-allergic, immunosuppressive and antimicrobial activity. The antibodies are useful as therapeutic agents for regulating cellular proliferation and differentiation and for treating all kinds of cancers, immune diseases such as allergic, autoimmune, and rheumatologic diseases, transplant rejection, and as anti-infectives for fighting viral, bacterial, parasitic and fungal infections. This sequence encodes the human CR1 protein described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            20-NOV-1991;

This invention describes a novel isolated antibody or antibody fragment (I) which selectively binds to a polypeptide encoded by cytokine response gene 2 (CR2) and modulates CR2 activity. The products of the invention have cytostatic, anti-allergic, immunosuppressive and antimicrobial activity. The antibodies are useful as therapeutic agents for regulating cellular proliferation and differentiation and for treating all kinds of cancers, immune diseases such as allergic, autoimmune, and rheumatologic diseases, transplant rejection, and as anti-infectives for fighting viral, bacterial, parasitic and fungal infections. This sequence is presented in the Seq ID list but is not described in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CR2; human; antibody; cytokine response gene; cytostatic; anti-allergic; immunosuppressive; antimicrobial; therapy; cell proliferation; treatment cell differentiation; cancer; immune disease; rheumatologic disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytokine response gene-related cDNA sequence (Seq

The encoded protein participates in the regulation, control and/or modulation of G-protein mediated signal transduction, involved in T cell activation, including T-helper (TH) cell and TH cell subpopulation activation. The protein can be used to develop products for treating autoimmune disorders, arthritis, graft rejection, asthma, allergy, infections or neoplasms.

The encoded protein participates in the regulation, control and/or modulation of G-protein mediated signal transduction, involved in T cell activation, including T-helper (TH) cell and TH cell subpopulation activation. The protein can be used to develop products for treating autoimmune disorders, arthritis, graft rejection, asthma, allergy, infections or neoplasms.

roles in immune responses, cell death, cell proliferation and stimulation of cell differentiation. M68 lacks a transmembrane domain and is a secreted factor suggesting that it functions as a natural inhibitor for its ligand. The altered expression pattern of M68 in a multitude of tissues suggests that M68 may play a role in cancer by binding to its ligand and blocking apoptotic cell death induced by such a ligand. This anti-apoptopic role of M68 suggests that modulators of M68 will be useful in treatment of apoptosis related diseases such as various forms of cancer and various bone disorders. M68 nucleic acids and proteins are therefore useful for treating conditions involving atypical apoptosis and for identifying modulators of M68. Modulators of M68 are useful for treatment of cancer and other diseases associated with abnormal levels of cancer and other diseases associated with abnormal levels of

The

protein is a member of a family of proteins which n immune responses, cell death, cell proliferation

Claim 19; Page 76-78; 80pp; English osteoporosis, Alzheimer's disease

Isolated human M68 nucleic acids and proteins which are part of the tumor necrosis factor receptor (TNFR) family, useful for identifyin modulators that may be used to treat various diseases e.g. cancer,  $\frac{1}{2}$ 

identifying

apoptosis including systemic lupus erythematosus, Hashimoto's thyrolditls, Grave's disease, idiopathic myzodmia, autoimmune diabetes, thrombotic thrombotycopenic purpura, multiple scelerc liver diseases, autoimmune gastritis, ulcerative colitis,

The promoter enhances gene expression in roots and can be used to confer disease resistance or immunity upon a susceptible plant root by transforming the plant with a composite gene capable of abundant expression in the gene, comprising the promoter and the gene of interest. This method can be used to transform plants, partic food crops that have roots susceptible to fungal or insect diseases. The roots of the transformed susceptible to fungal or insect diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      plants express a toxin or substance that provides immunity or resistance to the fungal or insect diseases. When the nucleic acid is provided in sense orientation, the transgenic the nucleic acid is provided in sense orientation, the transgenic plant is capable of removing a heavy metal from soil or groundwater, the heavy metal being e.g. cadmium, arsenate, arsenite, mercury, lead, zinc, nickel, bismuth, selenium, silver, gold or copper. PCS nucleic acids can also be used to decrease the level of heavy metal in the harvestable portion of a plant by expressing PCS in a non-harvestable portion and involves inhibiting expression of PCS in the harvestable portion of the plant. PCS polypeptides are used for the harvestable portion of the plant. PCS polypeptides are used for in vitro or in vivo biosynthesis of phytochelatins, and in a method of transferring a gamma-glutamylcysteine unit from 1 thiol peptide to another. The methods allow cost-effective and efficient bioremediation of contaminated soils and groundwaters, as well as
